Prompt 1
Tool: Gemini AI
Date: 09/10/26
Teammate: Iker Jesus Ortiz
Purpose: Round the corners of images and buttons
Prompt: Gem, how do I round the corners of images and buttons in Unity?
Response used: Method 1: 9-Slice Sprite (Standard uGUI)
This is the native, battle-tested approach in Unity that works for both standard UI Images and Buttons without shaders or extra packages.

1. Create a White Rounded Square Asset
    - Export a white rounded rectangle or square PNG (e.g., $64 \times 64px$ or $128 \times 128px$) from Figma, Photoshop, or an image editor.
    - Make it solid white so you can tint it to any color inside Unity.
2. Configure 9-Slicing in Unity
    - Drag the PNG into your project, select it, and set Texture Type to Sprite (2D and UI).
    - Click Sprite Editor in the Inspector.
    - Drag the green border handles inward (or set the Border values in the bottom-right panel) so that the four corner sections contain the rounded edges, leaving the straight edges and center inside the slice lines.
    - Click Apply in the top right.
3. Apply to Image or Button
    - Assign the sliced sprite to the Source Image slot on your UI Image (or the Target Graphic image on a Button).
    - Change Image Type from Simple to Sliced.
    - You can now resize the RectTransform to any width or height; the corners will maintain their curvature without stretching.

Prompt 2
Tool: ChatGPT

Purpose: Lower the opacity of the buttons
Prompt: How can I lower a button's opacity in the Inspector?

Response used:

Depending on how your button is set up and whether you want to fade just the background or the whole button (including text/icons), choose the method below:

Method 1: Lower the Graphic's Color Alpha (Background Only)

If you only want to fade the button's background image:

1. Select the Button GameObject in your Hierarchy.
2. In the Inspector, find the Image component (often the same GameObject, or referenced under the Button's Target Graphic).
3. Click the Color field to open the color picker.
4. Drag the A (Alpha) slider down from `255` (or `1.0`) to your desired transparency level.

Note: If the Button component uses Color Tint transitions, also make sure the Normal Color alpha is set to 255 so it doesn't multiply or override the base image alpha.
