Documentation of six cases

1- Reserving an available kit

Setup: Scenario A has at least one available kit.
Steps: Select an available kit, choose the 90 minute time slot, go through the contents and pickup screens and press the Home button at the end.
Expected result: The application shows the correct kit, pickup location and return time. The reserved kit becomes unavailable and cannot be selected again because it has just been borrowed.
Actual result: The expected result happens thanks to our implementation in Unity was made exactly like the prototype we made in Figma.
Status: PASS
Evidence:

2- No kits available

Setup: Scenario B has all kits unavailable for the current period.

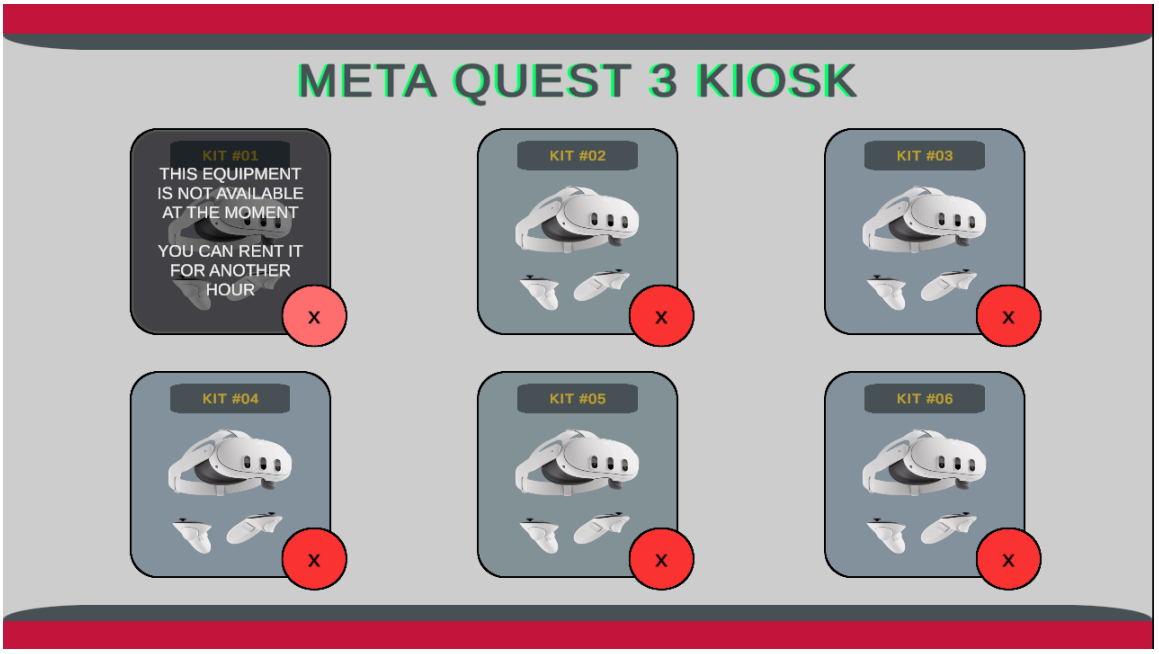

Steps: Follow the reservation flow, check the availability message when you pass the cursor on the icons of the quests and try the alternative offered by the application, such as choosing a future date to reserve a quest.

Expected result: The application explains that no kits are available for the current period and provides a working next step.

Actual result: When the user passes the cursor on a quest icon, a message appears that explains that no kits are available for the current period and provides a working next step.

Status: PASS

Evidence:

3- Selecting an unavailable kit

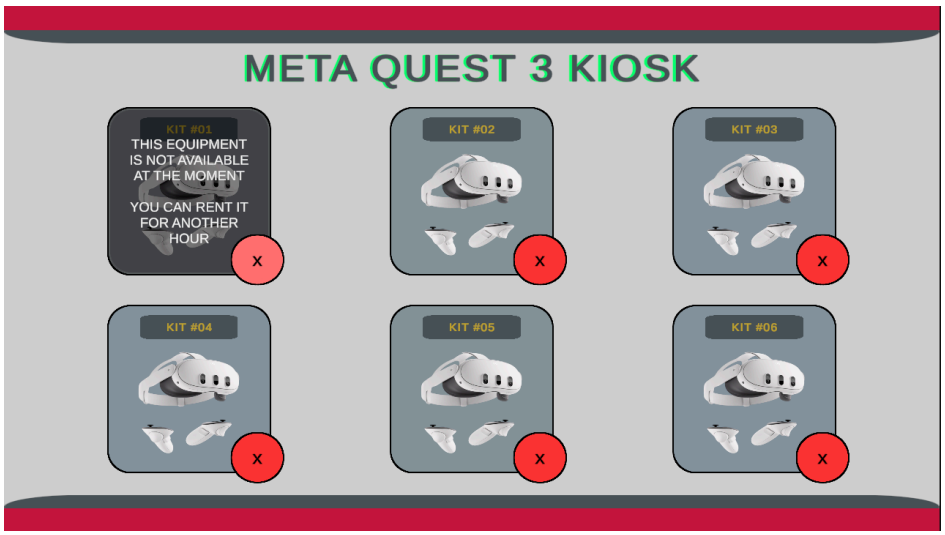

Setup: Only in scenario B the user can select a kit marked as unavailable.

Steps: Click that kit and continue with the flow of the reservation, you can only reserve a future date when a quest is not available.

Expected result: The application in scenario B allows the reservation to happen and the flow of the application is assured to the user so he can reserve the quest for a future day.

Actual result: The user can reserve a quest for a future day even if in the first screen of the application the kits all are unavailable, this can only happen in scenario B

Status: PASS

Evidence: 

4- Going back to edit a selection

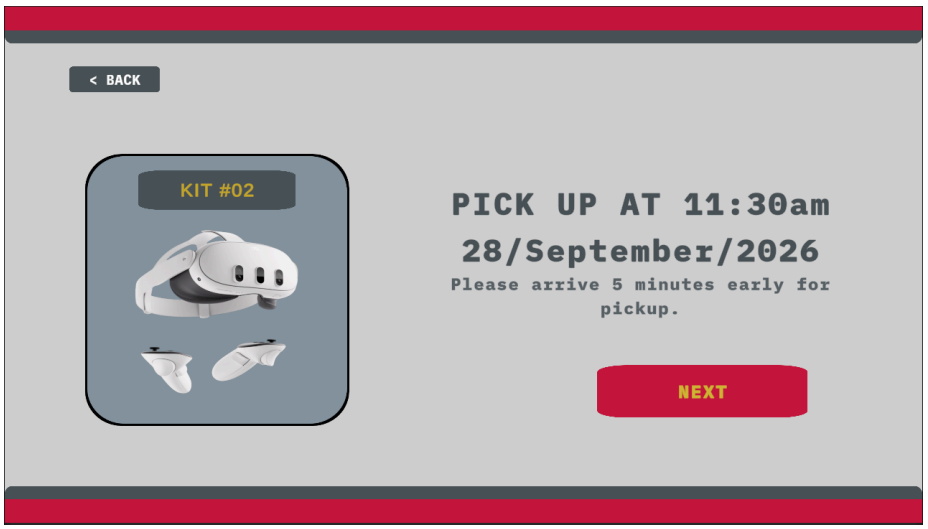

Setup: Select a kit and time, then reach the screen where the reservation can be reviewed.

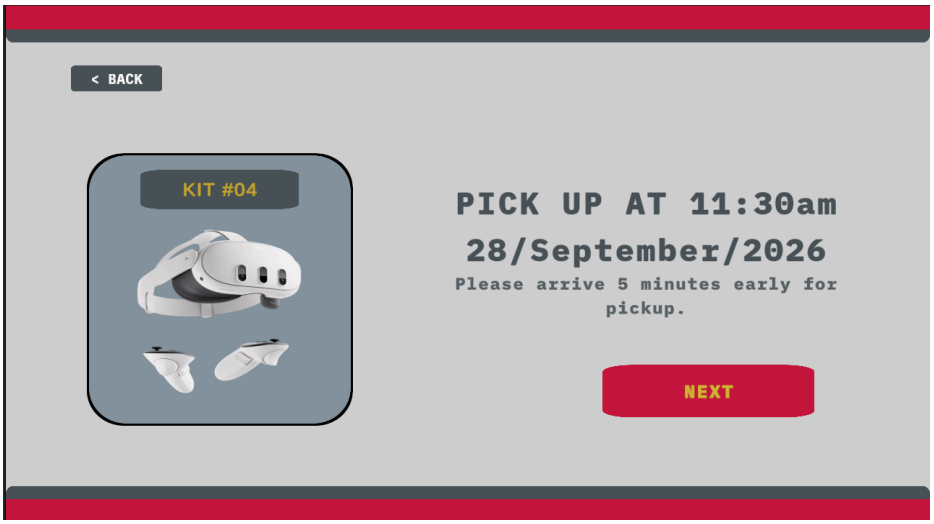

Steps: With the back button, you can go back to change a choice, such as the kit. Return to the calendar screen or you can go back and select another quest to reserve.

Expected result: The application shows the updated choice.

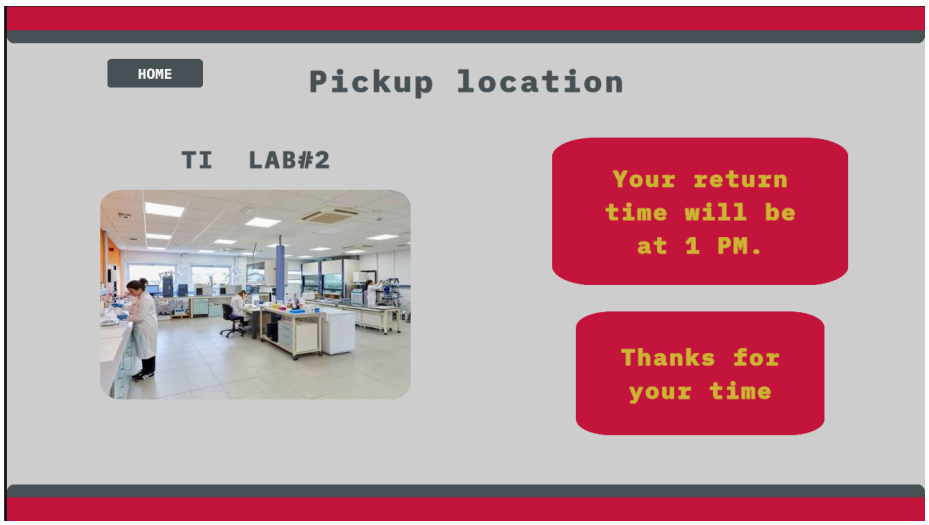

Actual result: The user can make the reservation flow of the application while trying to reserve the kit 01, if he chooses to reserve another one before confirming the reservation he can do that with the back button and select another quest and confirm that and the application will update his selected quest.

Status: PASS

Evidence: 

5- Persistence by Checking out the reservation
Setup: Complete a reservation and checkout.
Steps: Complete the reservation by getting the location pick up of the quest.
Expected result: The user gets the location where he can go and pick up the quest that he just reserved.
Actual result: After the user completes the reservation he then gets an image and the name of the location where he can pick up the quest that he just reserved.
Status: PASS

Evidence: 

6- Resetting the scenarios

Setup: Complete a reservation so the inventory is different from its initial state, this can be more easy to see in Scenario .

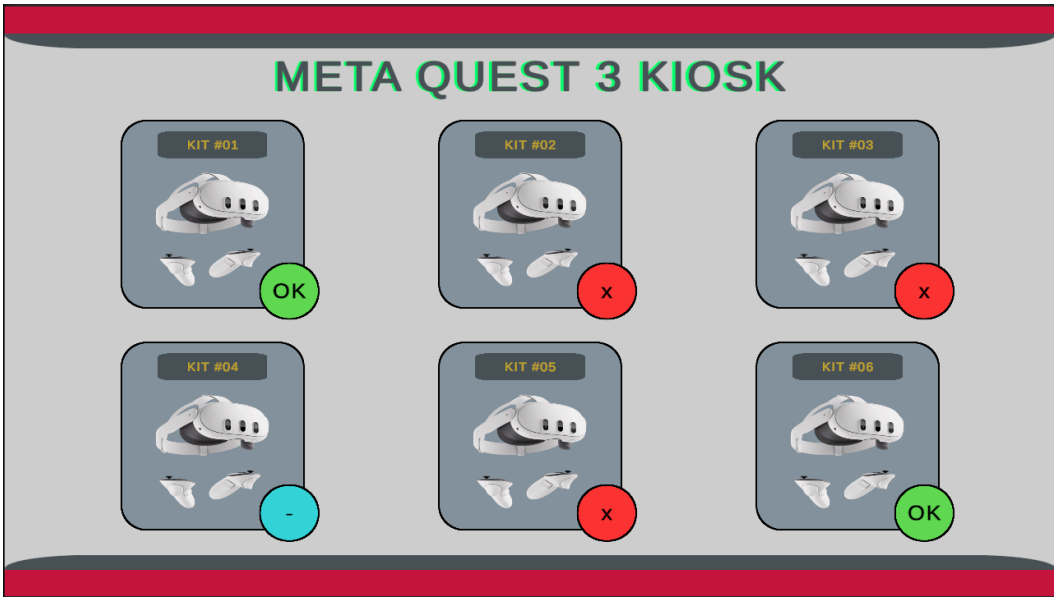

Steps: Reserve and available quest then click on the Home button and the quest that was just reserved will update its status to unavailable.

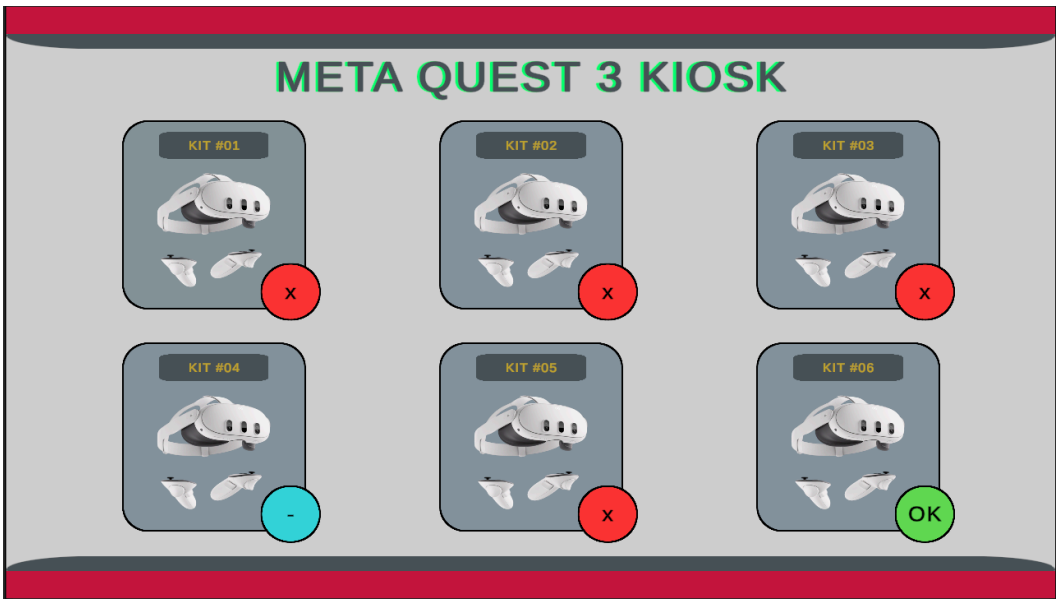

Expected result: The quest that is just reserved by the user changes its status from available to unavailable.

Actual result: When the user completes the flow of the reservation process the quest that he just reserved changes its status from available to unavailable.

Status: PASS

Evidence:

Identify the exact accessible build, Release, commit or version tested

This was the version that we used for testing:

I added more dynamic characteristics to our project based on Ikers work in this part of the project

User testing

User 1 - Gender: Male Age: 63
Completion: He completed both scenarios.
Time: For Scenario A : 52 seconds. For Scenario B: 1 minute and 5 seconds.
Errors: In Scenario B, in the calendar scene, when trying to reserve a time he didn't know that he needed to click a future day to reserve the quest in the future because he could not see the label of the current day because it was too small to be able to see at first, and he got lost for a few seconds.
Observations and help: Scenario A was easily more understandable for the user than Scenario B. I needed to help the user, telling him to select a future day in the calendar in Scenario B so he could end the flow of the scenario.

User 2 - Gender: Male Age: 46
Completion: He completed both scenarios.
Time: For Scenario A : 1 minute and 56 seconds, For Scenario B: 3 minutes and 34 seconds.
Errors: In both scenarios, the user encountered a visibility issue with the UI colors in the calendar section; the confirmation button was difficult to spot at a glance because the color lacked sufficient contrast, leaving the user unsure of how to confirm.
Observations and help: I realized the mistake immediately; I pointed out the confirmation button to him, and after the test, I changed the button's color.

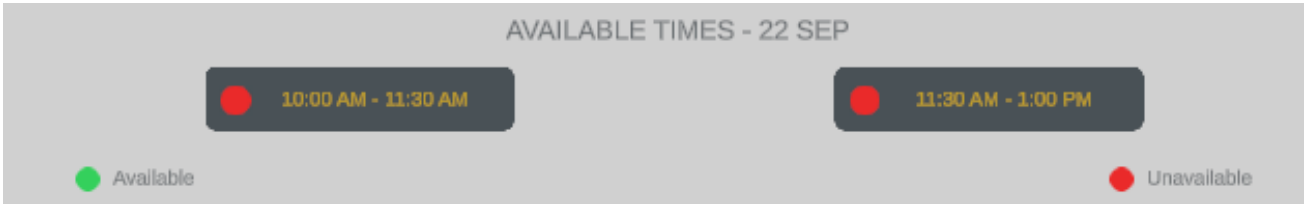

User 3 - Gender: Female Age: 19
Completion: He completed both scenarios
Time: For Scenario A: 36 secs, For Scenario B: 16 secs
Errors: NO
Observations and help: The subject was quick to complete the task and didn't spend much time on each screen; the only delay occurred when reading the calendar and selecting the available day and time slot. After that, they proceeded through the review screens quite happily—this applies to both scenarios.

Two fixes for usability problems supported by observations
Fix 1: In the calendars we fixed the size of the current time label and the available times and date label that is currently selected in the calendar, also in the available times and date label we change the text so it could be easier for users to identify that the current day that they are making the reservation there are no times available, as user 1 suggested after getting a little lost in scenario B because he could not identify the current date and time that he was making the reservation.

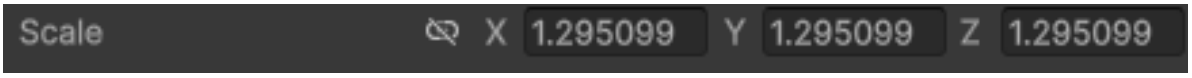

Before-and-after evidence

Before Fix 1:

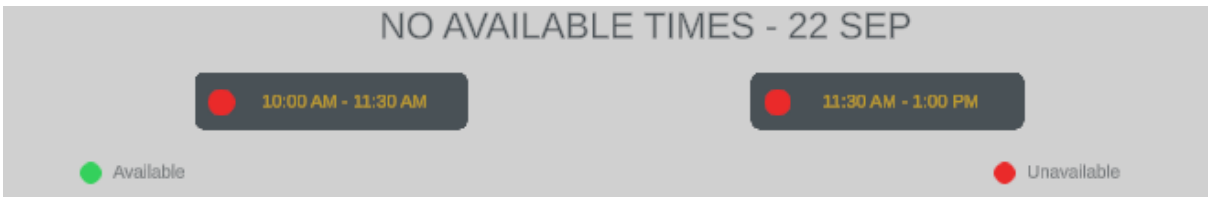

Scale of both labels before the fix: +

After Fix 1:

Scale of the text after the fix:

Fix 2: Change the button color so that the confirmation indicator is clearly visible, and also make it bigger.

Before-and-after evidence

Before Fix 2:

After Fix 2:

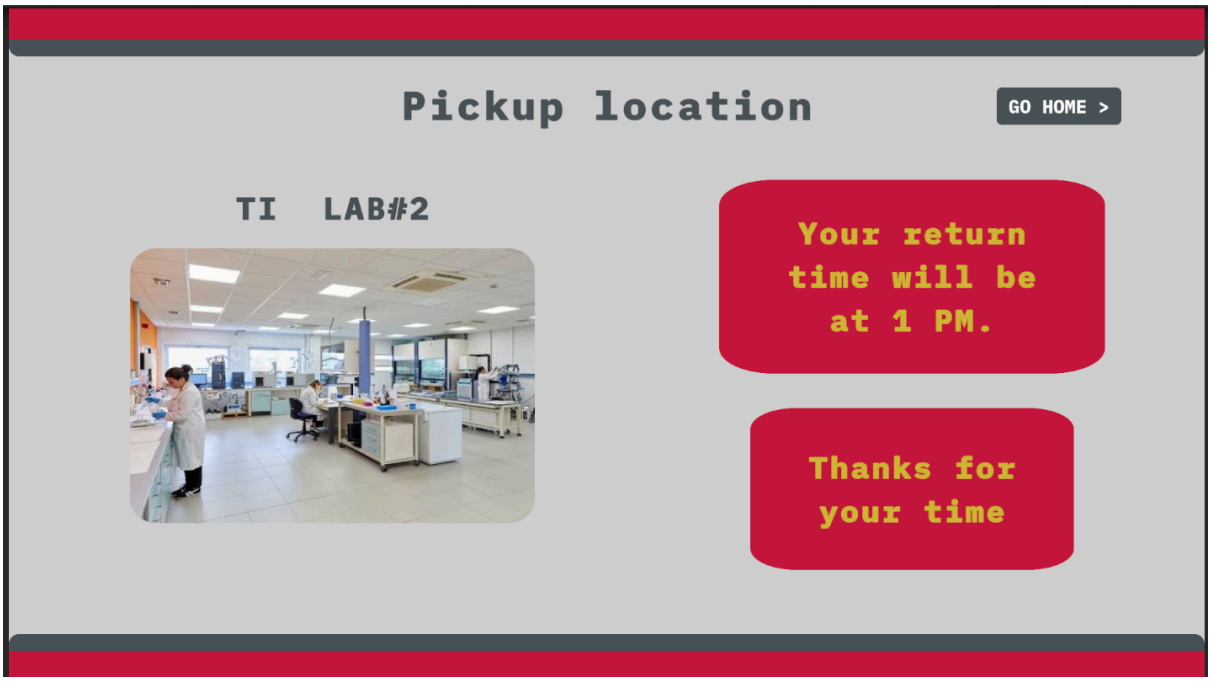

Fix 3: Before Fix 3: The user said that the HOME button was confusing because it is on the same side of the BACK button. So I changed the side and the text to be more specific.

Before-and-after evidence

After Fix 3:

Users retesting after the fixes

User 1 - Gender: Male Age: 63
Completion: He completed both scenarios.
Time: For Scenario A : 37 seconds. For Scenario B: 52 seconds.
Errors: In Scenario B, in the calendar scene, when trying to reserve a time he didn't know that he needed to click a future day to reserve the quest in the future because he could not see the label of the current day because it was too small to be able to see at first, and he got lost for a few seconds.
Observations and help: Scenario A was easily more understandable for the user than Scenario B. I needed to help the user, telling him to select a future day in the calendar in Scenario B so he could end the flow of the scenario.

User 2 - Gender: Male Age: 46
Completion: He completed both scenarios.
Time: For Scenario A : 1 minute and 5 seconds, For Scenario B: 2 minutes and 11 seconds.
Errors: No
Observations and help: The user was grateful about the error that we fixed on the color pattern of the confirmation button

User 3 - Gender: Female Age: 19
Completion: She completed both scenarios
Time: For Scenario A: 25 secs, For Scenario B: 14 secs
Errors: She again did not have any errors.
Observations and help: She again was quick to complete the task and didn't spend much time on each screen; she now did not have any delay navigating in our project.

Unresolved issues and limitations

We don't have unresolved issues on our project but we do have un identified limitations. The limitation is that the user can't select another day in the calendar to reserve a quest in that day even if that day appears to have an available time, this is because we preferred by logic that the user could only select the earliest day and time available based on the day that he was currently trying to reserve the quest.
